

Ultrasonic Motor Positioners

COMPACT DRIVES, FAST AND SELF-LOCKING

PILine® Ultrasonic Piezomotors

COMPACT DRIVES, FAST AND SELF-LOCKING

- Integration levels from economical OEM motors to multi-axis positioning systems
- Excellent dynamic properties, fast step & settle
- Basically unlimited travel ranges
- Easy mechanical integration
- Self-locking at rest
- Holding force up to 15 N
- Velocity up to 500 mm/s
- Resolution to 0.05 μm (50 nm)

Direct-driven PILine® linear motors

These linear drives dispense with the mechanical complexity of classical rotary motor/gear/leadscrew combinations. These components can be very susceptible to wear, especially in miniaturized systems.

The simplicity of the ultrasonic linear motor promotes its precision, reliability and cost efficiency. An integral part of the ultrasonic piezomotor is a piezo ceramic that is preloaded against a moving runner with a coupling

element. The piezo element is electrically excited to produce high-frequency oscillations that cause the runner to move.

Piezomotors are self-locking

The preload of the piezoceramic actuator against the runner ensures that the drive self-locks at rest and when powered down. As a result, it does not consume any power, it does not heat up and keeps the position stable mechanically. Applications with a short duty cycle, that are battery-operated or heat-sensitive benefit from these characteristics.

Lifetime and reliability

The motion of the piezoceramic actuator is based on crystalline effects and is not subject to any wear. The coupling to the runner, on the other hand, is subject to friction effects. Depending on the operating mode, running distances over 2000 km or a MTBF of 20000 hours are achieved.

Dynamics in use

The stiff design, direct coupling and fast response of the piezo ceramics to electric inputs allows for very fast start / stop behavior and velocities to hundreds of mm/sec.

Patented technology

The products described in this document are in part protected by the following patents:

US Pat. No. 6,765,335B2

European Patent No. 1267425B1

Motor-leadscrew combinations (above) transform the rotational motion of the motor into linear motion. Due to play in the mechanical components responsiveness is limited. Linear motors such as PILine® generate linear motion directly and provide much faster response and better stability

Piezomotors for all applications – e. g. in vacuum environments and strong magnetic fields

Piezomotors from PI are intrinsically vacuum-compatible and suitable for operation in strong magnetic fields. Special versions are offered for this purpose. Nanometer resolution or forces up to several 100 N can be achieved with PiezoWalk® linear motors.

The benefit of the low profile PLine® drives becomes apparent with positioning systems such as the M-660 rotation stage (left, 14 mm high) or the M-687 microscopy XY stage (right, 25 mm high): a consistently flat design without lead screw ducts or flanged motors

Implementation of rotary motion:
PLine® motors act on a ring-shaped runner

The piezoceramic actuator is excited with a high frequency electric signal (100 to 200 kHz). The deformation of the actuator leads to a periodic diagonal motion of the coupling element to the runner. The created feed is roughly 10 nm per cycle; the high frequencies lead to the high velocities

PLine® integration levels (left to right): OEM motor, U-264 RodDrive low-profile actuator (unguided) and M-272 closed-loop, guided linear actuator

Rotation Stage with Direct Drive

LOW PROFILE, FAST

M-660

- Low profile: Only 14 mm height
- Direct position measurement with up to 4 μ rad resolution
- Max. velocity 720 $^{\circ}$ /s
- Compact combinations with translation stages are possible
- Vacuum versions to 10^{-6} hPa

Precision-class rotation stage

With fast direct drive; unlimited slewing range. A vacuum-compatible version down to 10^{-6} hPa is available

PILine® piezo ultrasonic drive

Self-locking, no heat generation at rest. Excellent start/stop dynamics. Non-contact reference point switch

Direct measuring principle

Non-contact measuring, optical linear encoder. Variants with different resolutions. High repeatability

Valid patents

US Patent No. 6,765,335B2

European Patent No. 1267425B1

Application fields

Research and industry. For micromanipulation, automation, optical metrology

XY Stage with Piezoceramic Linear Motors

HIGH STABILITY AND SPEED, LOW-PROFILE, DIRECT POSITION MEASUREMENT

M-686

- Higher stability with self-clamping linear motors
- Max. velocity 100 mm/s
- Very low profile of only 32 mm, no protruding parts
- Travel range 25 × 25 mm
- 100 nm, optical linear encoders provide excellent repeatability and accuracy

Precision-class XY stage

With fast direct drive. Clear aperture 78 × 78 mm, 65 × 65 mm at full displacement

PILine® piezo ultrasonic drive

Self-locking, no heat generation at rest. Excellent start/stop dynamics. Flat supporting surface, no lead screw ducts or flange-mounted motors. Crossed roller guide for higher running accuracy and load capacity. Non-contact limit and reference point switches

Direct measuring principle

Non-contact, direct-measuring, optical linear encoder per axis. High repeatability

Valid patents

US Patent No. 6,765,335B2

European Patent No. 1267425B1

Application fields

Research and industry. For microscopy, biotechnology, laboratory automation. Special versions for standard light microscopes available on request

Customized M-686 stage with a bigger footprint makes it possible to sink the piezo Z scanner. The system height together with the P-541 piezo scanner is reduced to only 33 mm.

The following stages fit directly

P-561 • P-562 • P-563 PIMars Nanopositioning Stage

P-541.2 • P-542.2 Piezo XY Stage

P-541.Z Vertical Nanopositioning Stage

OEM Piezomotors

TECHNICAL DATA

Different integration levels offer flexibility

PILine® allow the design of positioning systems with higher dynamics and smaller dimensions. PI offers various integration levels of PILine® drives for easier integration into customer designs:

- Complete positioning stages with integrated PILine® motors are available in custom designs for OEMs,
- Linear actuators move the load via a guided rod. Position feedback is available as an option,

■ RodDrives are unguided and open-loop linear drives that replace motor-lead screw combinations. They can easily be coupled to a guided positioning platform,

- The integration of OEM motors requires more experience and technical knowledge because the optimal preload between runner and actuator has to be set-up by the customer.

Drive electronics

To produce the ultrasonic oscillations in the piezo actuator, special drive electronics are required that are also provided by PI. These range from OEM boards to integrated servo controllers for closed-loop systems.

OEM motor

Drive electronics create the ultrasonic oscillations in the piezo-ceramic actuator of the PILine® drive. PI offers universal drives for all actuator sizes – as well as specialized, compact boards

PILine® Piezo Linear Drive	P-661	U-164	Unit	Tolerance
Motion and positioning

Mass	10	20	g	±5 %

* The travel range of piezo linear motors is practically unlimited and it only depends on the length of the runner

** The minimum incremental motion is a typical value which can be reached in open-loop operation. However, it is important to follow the installation guidelines for the motors

Open-loop step sequence of a PILine® based translation stage. Steps of approx. 300 nm shown. For repeatable increments closed-loop operation is recommended, because the step size depends on the force applied from outside

PILine® ultrasonic linear motors provide excellent dynamic properties. They provide acceleration to several g and can achieve step and settle of a few 10 ms for small distances

Maximum duty cycle depending on the ambient temperature with a control signal level of 100 %

Force / velocity motor characteristic of a U-164 PILine® motor. The percentages refer to the control signal level, which denotes the coupling of the electric power of the actuator

	C-867.160	C-867.260
Function	Controller for single-axis positioning or scanning stages	Controller for XY positioning or scanning stages
Drive type	PILine® motors, single and dual drives with P-661, P-664, U-161 and U-164	
Channels	1	2
Motion and control		
Servo characteristics	Programmable PID filter, parameter changes on the fly	
Trajectory profile modes	Trapezoid	
Encoder input	A/B (quadrature) differential, 50 MHz	
Stall detection	Servo off, triggered by programmable position error	
Limit switches	2 TTL (programmable) per channel	
Reference point switch	1 TTL per channel (active high/low, programmable)	
Electrical properties		
Max. output power per channel	15 W	
Max. output voltage per channel	200 V _{pp}	
Interface and operation		
Communication interfaces	USB, RS-232	
Motor connector	MDR14	2 × MDR14
Controller network	Up to 16 units on single interface	
I/O ports	4 analog/digital in 4 digital out (Mini-DIN, 9-pin) Digital: TTL Analog: 0 to 5 V	
Command set	PI General Command Set (GCS)	
User software	PIMikroMove	
Software drivers	GCS-DLL, LabVIEW driver	
Supported functionality	Start-up macro, macro, data recorder for recording parameters as motor input voltage, velocity, position or position error	
Manual control	Pushbutton box, joystick (for two axes), Y cable for 2-D motion	Pushbutton box, joystick (for two axes)
Miscellaneous		
Operating voltage	24 VDC from external power supply (included)	
Max. operating current	300 mA plus motor current (max. 2 A)	600 mA plus motor current (max. 4 A)
Operating temperature range	5 to 40°C	
Mass	1 kg	2.4 kg
Dimensions	206 × 130 × 66 mm (incl. mounting rails)	320 × 150 × 80.5 mm (incl. mounting rails)

Ask about custom designs!

The two-channel C-867.260 controller serves to control XY scanning stages, as in this case a customized M-686 stage for microscopy

Pi: drives that Set the World in motion

PRECISION POSITIONING FOR SCIENCE AND INDUSTRY

Future Technology Solutions

Today PI delivers micro- and nanopositioning solutions for all important high-tech markets:

- Semiconductor technology
- Optical metrology, microscopy
- Biotechnology and medical devices
- Precision automation and handling
- Precision machining
- Data storage technology
- Photonics, telecommunications
- Nanotechnology
- Micropositioning
- Aerospace engineering
- Astronomy

PI (Physik Instrumente) is the leading supplier of piezo-based positioning systems with accuracies in the range of a few nanometers.

The extensive product portfolio is based on a wide range of technologies with electromotive or piezoelectric drives for up to six motion axes. Hexapods, nanometer sensors, control electronics as well as software and are supplemented by customized solutions.

All key technologies are developed in-house. This means that every phase from the design right down to the shipment can be controlled: The precision mechanics and the electronics as well as the position sensors and the piezo ceramics or actuators. The latter are produced by the subsidiary company PI Ceramic.

PI is, therefore, the only manufacturer of nanopositioning technology which employs the piezoelectric drives it produces. This ensures a high degree of flexibility for developing customized piezoceramic components.

More than 100 patents and patents applied for stand for more than 40 years of experience and pioneering work. PI products are employed wherever technology in industry and research is pushed forward – worldwide.

With four German factories and ten subsidiaries and sales offices abroad, the PI group is represented internationally.

PI stands for quality in products, processes and service. The ISO-9001 certification which focuses not only on product quality but also on customer expectations and satisfaction was achieved back in 1994.

PI is also certified according to the ISO 14001 (environmental management) and OHSAS 18001 (occupational safety) standards, which taken together form an Integrated Management System (IMS).

milestones

THE SUCCESS STORY

- 1970** PI founding year
- 1977** PI moved its headquarters to Waldbronn, Germany
- 1987** Foundation of a subsidiary in the USA
- 1991** Foundation of a subsidiary in Japan
- 1991** Market launch of 6-axis parallel-kinematics positioning systems (Hexapods)
- 1992** Foundation of PI Ceramic, Thuringia, Germany; crucial step towards market leadership in nanopositioning
- 1993** Foundation of subsidiaries in the UK and in France
- 1994** Market launch of capacitive position sensors
- 1995** Foundation of a subsidiary in Italy
- 1998** Market launch of digital control electronics
- 2001** Market launch of PISLine® ultrasonic piezomotors
- 2001** New company building in Karlsruhe, Germany
- 2002** PI Ceramic company building extended
- 2002** Foundation of a subsidiary in China
- 2002** Market launch of PICMA® multilayer piezo stack actuators
- 2004** Market launch of NEXLINE® high-performance piezo linear drives
- 2007** Market launch of NEXACT® piezo linear drives
- 2010** Acquisition of the expansion site next to the PI headquarters
- 2011** Foundation of a subsidiary in Korea
- 2011** Foundation of a subsidiary in Singapore
- 2011** Acquisition of the majority shares of miCos GmbH
- 2012** Extension of the PI headquarters company building in Karlsruhe

PI General Catalog

Request it now!

The 530 page hardbound catalogue from PI is the most comprehensive reference book on the fundamentals of nanopositioning, piezo systems and micro-positioning technology yet. The catalog contains 200 product families, with more than 1000 drawings, graphs, images and technical diagrams.
